

## Simple, effective voice enhancement

### CAM27: Trinity Enhance™

Derived from the CEDAR Trinity surveillance system supplied to law enforcement and security agencies, Trinity Enhance has been designed specifically for audio forensic use.

It provides four related tools that allow users to suppress continuous tones, eliminate background noise, reveal the wanted voices, and increase the intelligibility of the speech. It also allows you to enhance the background if that contains wanted detail. This is particularly valuable when there are one or more speakers who are more distant than the primary speaker, or who are whispering and therefore much quieter than others.

#### Speed and simplicity

With just four sliders and no hidden menus of parameters, Trinity Enhance is incredibly quick and simple to use, and it allows even novice users to clean difficult material to a standard that would have seemed impossible just a few years ago. When speed and simplicity are paramount, it's not only the easiest combined noise reduction and speech enhancement tool to use, it's also the most effective.

#### Stunningly effective voice enhancement for audio forensics
